

Evidence Accumulation Model Analysis

CURRENT MODEL (Global Threshold):

- Single threshold: 4.28
- All trials use same threshold
- RT difference: 0.02s (not significant)

HUMAN BEHAVIOR (Adaptive Threshold):

- Easy: Low threshold -> Fast decision
- Difficult: High threshold -> Slow decision
- RT difference: 0.10s (significant)

KEY INSIGHT:

The model learns a global optimal threshold that balances ALL trials together, but doesn't capture difficulty-specific decision strategies.

IMPROVEMENT DIRECTIONS:

1. Stimulus-specific threshold (8 thresholds)
2. Difficulty-conditioned threshold (2 thresholds)
3. Adaptive threshold (input-dependent)
